

## Bug Fixes

**ID :** 1618**Fixed in version :** 4.0.1**Short Description:** Editclear() do nothing without return value

**Full Description:** in your example library, please import the document in attached zip file.  
The document presents 2 tables. In the first one, select the field "<Pour chaque compogravure" (1st table, line 2, 1st cell, 2nd line)  
Now, if I press the del key, nothing happens.  
Same result if I use context menu "clear" and method \$editclear() returns 0 as if all was ok...

NB: consider our software searches and deletes this kind of fields before calling for \$eval as part of our process

Please, could you tell me what is wrong with this ?  
Thank you in advance.  
Joel

AttachedFile: PbEditClear.zip

**Comments :** For case 1527 we added some code to prevent the accidental merging of two adjacent tables. However, the code failed to accurately detect when deletion was occurring within the confines of a table cell. This has now been rectified.

**ID :** 1620**Fixed in version :** 4.0.1**Short Description:** Problems with Export to JSON and Import from JSON Case CA08611

**Full Description:** The issue is when you export a library that uses you oWrite component to JSON, then some of the properties are not exported as expected.  
See the attached example library, JSON export and image.  
The properties found so far are \$backcolor & \$forecolor.

**Comments :** We have updated OWrite with new flags required by the JSON export.
